Kameti - Learning Depth per Topic

Target level: you can read a 30-line snippet, say what it does line by line, predict its output, and make a small change without breaking it. You don't need to write it from scratch yet.

Topic	Depth	You're ready when you can...
JS gaps	Read fluently	Read destructuring, spread, map/filter/reduce, optional chaining, template literals, closures, JS class syntax, throw/custom errors, and require/module.exports without stopping
Node + npm	Light	Run a script, install a package, read package.json, use process.env
HTTP/REST	Medium	Open the browser DevTools Network tab and explain a request's method, status, headers, cookies, and body
Express	Medium-deep	Explain what (req, res, next) does and why middleware order matters. This is the core of your auth design
SQL	Deepest	Write CREATE TABLE with constraints, INSERT/SELECT/UPDATE/DELETE, INNER and LEFT JOIN, GROUP BY with SUM/COUNT, and a transaction
better-sqlite3	Light	Use prepare().run()/get()/all() with ? placeholders
Auth	Concept + usage	Explain hashing vs encryption, what a session cookie does, and call bcrypt.hash/compare. You don't need the internals
Security	Concept level	Explain in one sentence each: SQL injection, XSS, IDOR, why the server never trusts client input
Frontend DOM	Mostly done	Select elements, handle events, build elements with textContent, read a form, and fetch into the DOM. Only small gaps remain: form submit + preventDefault, POST with fetch, event delegation
Architecture/SOLID	Concept level	Say which layer a piece of code belongs to, and understand dependency injection as "pass it in as an argument"
Git	Basic	add, commit, branch, push

Learn later, when you reach them: Nodemailer, timezones, testing, cron, deployment.
